

Practice Set 10

- ① Find the Laplace transform of

$$x(t) = e^{-t^2} \text{ for all } t.$$

You can use the fact:

$$\int_{-\infty}^{+\infty} e^{-(t-a)^2} dt = \sqrt{\pi} \text{ for any } a \in \mathbb{C}.$$

- ② In question ① we saw a two-sided signal e^{-t^2} whose ROC is the entire s -plane.

Now consider another two-sided signal

$$x(t) = \frac{1}{1+t^2} \text{ for all } t.$$

(a) Find the ROC of this signal.

(b) Find the ROC of:

$$e^{-t^2} u(t) + \frac{1}{1+t^2} u(-t)$$

Is the boundary line a part of the ROC or not?

③ (Examples 9.9, 9.10, 9.11).

$$\text{For } X(s) = \frac{1}{(s+1)(s+2)},$$

(a) Find all possible ROCs.

(b) For each of these ROCs find the inverse Laplace transform, i.e. find $x(t)$.

④ Find the Laplace transform of:

(a) $\sin(\omega_0 t + \phi_0) u(t)$

(b) $e^{-a|t|}$ where a is real and $a > 0$.

(c) $e^{-a|t-t_0|}$, where $a > 0$.

⑤ (Example 9.20 from OWH).

(a) If $h(t)$ is the impulse response of an LTI system,

and this system is stable, then:

does the $j\omega$ axis of the s -plane belong to the ROC?

(b) If $H(s) = \frac{s-1}{(s+1)(s-2)}$ and if the system is

stable, identify the ROC.

(c) Find $h(t)$ assuming that the system is stable.

(d) Again, if $H(s) = \frac{(s-1)}{(s+1)(s-2)}$, and if the

system is stable, what can we say about the causality of this system?

(e) What if $H(s)$ is as before, but now we are told that this LTI system is causal, what is $h(t)$ in this case?

⑥ Suppose $h(t)$ is the impulse response of an LTI system that is both stable and causal. Also, suppose $H(s)$ is rational.

Argue that every pole of $H(s)$ has negative part.

Stable, Causal LTI
system:

All poles have
-ve real parts.

⑦ Based on Example 9.24 of GWN (& Lec 27 of EE1101)

The differential equation describing this system is:

$$\frac{d^2 y}{dt^2} + \frac{R}{L} \frac{dy}{dt} + \frac{1}{LC} y(t) = \frac{1}{LC} x(t).$$

(a) Apply Laplace transform to either side of this equation and find $\frac{Y(s)}{X(s)}$.

Remark: Since this is an LTI system:

$$y = x * h \Rightarrow Y(s) = X(s) \cdot H(s)$$

$$\Rightarrow H(s) = \frac{Y(s)}{X(s)}.$$

(b) Denote $\sqrt{\frac{1}{LC}} = \omega_0$ and $\zeta = \frac{R}{2} \sqrt{\frac{C}{L}}$

Write $H(s)$ in terms of ε and ω_0

(c) Find all the poles of $H(s)$ in terms of ε and ω_0 . Note that $\varepsilon, \omega_0 > 0$.

(d) Consider the following cases:

(i) $\varepsilon > 1$ (called overdamped case)

Show that both poles are: real and negative, and are distinct.

(ii) $\varepsilon = 1$ (called critically damped case)

Show that both poles are: identical, real and negative.

(iii) $\varepsilon < 1$ (called underdamped case)

Show that both poles are: non-real, have negative real part and are conjugates of each other.

(Use $\omega_d = \omega_0 \sqrt{1 - \varepsilon^2}$ in your calculations).

(e) This circuit is a causal LTI system, and hence, $h(t)$ is a right-sided signal.

Find $h(t)$ for each of the three cases:

$\varepsilon > 1$, $\varepsilon = 1$ and $\varepsilon < 1$.

(f) What is $h(t)$ if $\varepsilon=0$ and $\omega_0>0$?

This is the undamped system.

⑧ Exercise problems from BWN:

9.6, 9.9,

9.22 (a), (b), (c), (g)
